Sequence 22, Application US/09309487

Patent No. 6335318

GENERAL INFORMATION:

APPLICANT: Selsted, Michael E.

APPLICANT: Tang, Yi-Quan

APPLICANT: Tang, Yi-Quan

APPLICANT: Ouellette, Andre J.

TITLE OF INVENTION: Antimicrobial Theta Defensins and Methods of Using Same

FILE REPERENCE: P-UC 3095

CURRENT APPLICATION NUMBER: US/09/309,487

CURRENT FILING DATE: 1999-05-10

NUMBER OF SEQ ID NOS: 31

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 22

LENGTH: 92
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 22, Application US/09967808

Sequence 22, Application US/09967808

Patent No. 6514727

GENERAL INFORMATION:

APPLICANT: Selsted, Michael E.

APPLICANT: Yuan, Jun

APPLICANT: Yuan, Jun

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              US-10-141-645-45
Sequence 45, Application US/10141645
Patent Robert Lehrer
Patent No. 6713078
GENERAL INFORMATION:
APPLICANT: Robert Lehrer
APPLICANT: Alan Waring
APPLICANT: Alan Waring
APPLICANT: Teresa Hong
TITLE OF INVENTION: Retrocyclins - Antiviral and
TITLE OF INVENTION: Antimicrobial Peptides
FILE REFERENCE: UCLA-001CIP
FILE REFERENCE: UCLA-001CIP
CURRENT FILING DATE: 2002-05-06
       CURRENT APPLICATION NUMBER: US/09/967,808
                              CURRENT FILING DATE: 2001-09-26
PRIOR APPLICATION NUMBER: US/09/309,487
PRIOR FILING DATE: 1999-05-10
NUMBER OF SEQ ID NOS: 31
SOFTWARE: PATENTIN VET: 2.0
SEQ ID NO 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TYPE: PRT

Sequence 40304, Application US/09270767

Parent No. 6703491

GENERAL INFORMATION:

APPLICANT: Homburger et al.

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster;

FILE REFERENCE: File Reference: 7326-094

CURRENT APPLICANTION NUMBER: US/09/270,767

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SEQ ID NO 49304

LENGTH: 96

hypothetical protein C06A1.6 - Caenorhabditis elegans

Rimcharray, A. submitted to the EMBL Data Library, June 1995
A;Reference number: Z19054
A;Accession: T18975
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Aldelet type: DNA

A; Experimental source: clone C06Al

A; Gene: CESP: C06A1.6

Map position: 2

A; Molecule type: DNA

```
Probable membrane protein YJL064w - yeast (Saccharomyces cerevisiae)
N.Alternate names: hypothetical protein HRC131; hypothetical protein J1120
C,Species: Saccharomyces cerevisiae
C,Species: Saccharomyces cerevisiae
C,Species: Sacharomyces cerevisiae
C,Species: Sacharomyces cerevisiae
R,Vandenbol, M.; Durand, P.; Dion, C.; Portetelle, D.; Hilger, F.
Yeast 11, 57-60, 1995
A,Title: Sequence of a 17.1 kb DNA fragment from chromosome X of Saccharomyces cerevisiae
A,Reference number: S50798; MUID:95282514; PMID:7762302
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               C;Accession: B45878

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  C. Comment: Epidermal growth factor (EGF) stimulates the proliferation and differentiation gastrointestinal cell proliferation.

C. Comment: EGF is released in the pancreas, small intestine, mammary gland, and (in some C. Comment: The EGF precursor is found in kidney as a receptor-like membrane-bound protein C. Comment: The active growth factor from this submaxillary gland protein stimulates the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Whatermal growth factor precursor - mouse bydermal growth factor precursor - mouse bydermal growth factor precursor C; Matternate names: urogastrone precursor C; Species: Mus musculus (house mouse) C; Date: 30-Nov-1980 #sequence_revision 11-Aug-1983 #text_change 09-Jul-2004 C; Date: 30-Nov-1980 #sequence_revision 11-Aug-1983 #Text_change 09-Jul-2004 R; Scott, J; Urdea, M.; Quiroga, M.; Sanchez-Pescador, R.; Fong, N.; Selby, M.; Rutter, Science 21, 236-240, 1983 #Title: Structure of a mouse submaxillary messenger RNA encoding epidermal growth factor A; Reference number: A94272; MUID:83223630; PMID:6602382
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A Molecule type: mRNA

NyAlternate names: low molecular mass surfactant protein type 1
Cispecies: Sus scrofa domestica (domestic pig)
Cispecies: 3L-bec-1991 #sequence_revision 31-bec-1991 #text_change 09-Jul-2004
Ciscession: 500363
KiCurstedt, T.; Johansson, J.; Barros-Soederling, J.; Robertson, B.; Nilsson, G.; Westbe Bur. J. Blochem. 172, 521-525, 1988
Aprite: Low-molecular-mass surfactant protein type 1. The primary structure of a hydrop Apreference number: 800363; MUID:88166729; PMID:3350011
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              neurotoxin Tx2 - spider (Phoneutria nigriventer)

"cDNA cloning of three alpha-defensins and three demidefensins from "cpNA cloning of three alpha-defensins and three bone marrow.";

Submitted (SEP-1999) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Microbicidal activity against Gram-positive bacteria S. typhimurium S. aureus and L. monocytogenes, Gram-negative bacteria S. typhimurium and E.coli MLJ5 and fungi C.albicans and C. neoformans in vitro.

-!- SUBUNIT: Heterodimer of subunit A and subunit B linked by a disulfid bond at position 66 forming a cyclic RTD-1.

-!- TISSUE SPECIFICITY: Bone marrow; promyelocytes, myelocytes and mature neutrophils and monocytes.

-!- DEPLOPMENTAL STAGE: Expression and peptide accumulation starts

The present invention describes a method (MI) of using a first anti-viral peptide (I) comprising a theta-defensin peptide in an amphipathic alphace helical structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used to reduce virus growth, infectivity burden, shed, and development of anti-viral resistance. (I) can be used for inhibiting the growth and proliferation of a virus and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus in subject harbouring a latent virus, controlling virus in subject harbouring a latent virus, controlling virus shed from a VS. reducing percentage of VS in a population regardless of viral infection status, or inducing latency in a VS, reducing the infectivity of a virus; and (c) rendering virus or fluid sample safe for use, or reducing the number of infectious virus particles in a population of viruses. (MI) is useful for reducing the infectivity of a virus in sheep, cattle, horses, swine, cats, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is a daministered to a patient who is immunosuppressed or to a subject who is contacting the virus. The present contacting the virus, where the first anti-viral peptide is administered prior to or subsequent to the virus contacting the subject. The anti-viral peptide is most preferably administered to a subject who is fared to a variance of the anti-viral peptide is sequence represents a rhesus monkey theta defensin anti-viral peptide, which is given in the exemplification of the present invention
 Anti-viral, viral infection; theta-defensin; lipid environment; amphipathic alpha-helical structure; virucide; anti-HIV; immunisation; viral growth inhibitor; viral proliferation inhibitor.
 New method of using a first anti-viral peptide comprising a Theta-defensin peptide in an amphipathic Alpha-helical structure in a lipid environment for reducing the infectivity of a virus.

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as AD035239-AD03527. The theta defeatiled in the claims or appearing as AD035239-AD035257. The theta defeatiled in the claims or appearing or inhibiting growth or survival of a microorganism in an environment such as food or growth or survival of a microorganism in an environment such as food or colution, an inanimate object comprising surface, or a mammal. The solution, an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbistatic inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present
 Novel theta defensin analog useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate object.
 high antimicrobial activity and low haemolytic activity. The present sequence represents the rhesus monkey wild-type theta defensin RTD-3
 Example 1; SEQ ID NO 3; 46pp; English.

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of a microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbiscidal inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from sequence rill, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents a Rhesus theta defensin analogue peptide.

This invention describes a novel conjugate for treating prokaryotic confections which comprises a transport mediator for passage through the prokaryotic cell membrane and a compound, directed against a prokaryote cand intended for introduction into it. The prokaryote is a bacterium, especially one pathogenic in humans. The transport mediator is preferably a human peptide or protein, especially a phage-holin protein, its active crassitance to penciallin, terracycline, ampiciallin protein, its active conjugate has the structure transport mediator-spacer. The conjugate has the structure transport mediator through a caids and the spacer is poly(glycine and/or lysine), preferably containing 2-6 amino acids and the spacer is linked to the transport mediator through a caids and the spacer is linked to the transport mediator through a cide apply glycine and/or lysine), preferably containing 2-6 amino acids and the spacer is linked to the transport mediator through a cide and the invention have antibacterial activity and are used, crespecially in combination with antibiotics, for treating prokaryotic, specially bacterial, infections, especially where the pathogen is products of the invention have antibiotics and then the PNA is directed against the antibiotic resistance gene where the PNA is directed against containing the condministered antibiotic and then the PNA is directed against antibiotic resistance gene the conjugate will render the bacteria cused sensitive to co-administered antibiotics i.e. 'old' antibiotics can be congenicate accessfully the especial defensin fragment described in the conception.
 ö
 New conjugate of transport mediator and active agent, useful for treating prokaryotic infections, especially by neutralizing antibiotic resistance

for preparing a composition for treatment and/or prevention of bactersamia for binding bacterial products such as lipopolysaccharide bactersamia for binding bacterial products such as lipopolysaccharide of septic shock. RTD-1, isolated from immune cells of rhesus monkeys, has antibacterial, fungicide, virucide, immunomodulator and anticoagulant activity. RTD-1 inhibits microbial cell-wall biosynthesis and also binds to LPS and LTA. RTD-1 is useful for treatment and prevention of severe by viruses. RTD-1 combines four advantageous properties: a direct antimicrobial action, neutralisation of bacterial products (by binding), immunomodulation (reducing release of proinflammatory cytokines but increasing release of regulatory factors) and anticoagulant action, so provides a better and simpler treatment.
 This invention describes the novel use of rhesus theta defensin-1 (RTD-1)
 Use of rhesus theta defensin-1 for treating or preventing bacteremia and septic shock, also for binding bacterial products and as immunomodulator and anticoagulant.
 Monkey, Rhesus theta defensin, RTD-1; antimicrobial peptide; cyclic; antimicrobial, antinflammatory; antibacterial; virucide; fungicide; food; contact lens solution; eye wash solution; inflammatory response; microbicidal inhibition; microbistatic growth inhibition; disinfectant; food preservative; bacterial infection; viral infection; fungal infection; haemolytic activity.

 The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or growth or survival of a microorganism in an environment such as food or or obtained, a solution (e.g., contact lens solution, or eye wash solution, an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbistatic inhibition of survival of microorganism as well as microbistatic inhibition of growth. Thus the peptides are useful as the repetides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The there defensing have becterial, viral, fungal or other infection. The there defensing have high antimicrobial activity and low haemolytic activity. The present

 The present invention describes a method (MI) of using a first anti-viral peptide (I) comprising a theta-defensin peptide in an amphipathic alphabatical structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used to reduce virus growth, infectivity burden, shed, and development of antiparticle fargarden. (I) can be used for inhibiting the growth and proliferation of a virus and so can be used for; (a) protecting or reating subject from a viral infection, preventing recurrent viral infection in a subject harbouring a latent virus, controlling virus in subject harbouring a latent virus, controlling virus in subject harbouring a latent virus, controlling virus in special shed from a VS, reducing percentage of VS in a population regardless of viral infection status, or inducing latency in a VS, (b) reducing virus latentivity of a virus; and (c) reducing latency in a voi, (b) reducing the infectivity of a virus in sheep, cattle, horses, swine, contaminated tissue or fluid sample safe for use, or reducing the number of infections virus particles in a population of viruses (MI) is useful cars, fowl and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is administered to a patient who is immunosuppressed or to a subject who is not infected with the virus, where the first anti-viral peptide is administered to a patient who are subject who is anti-viral peptide is a chuman intera defensin anti-viral peptide is a human there defensin anti-viral peptide, which is caused.

The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide

The invention relates to a novel isolated retrocyclin peptide. The invention further provides: a cyclic polypeptide; an isolated nucleic acid encoding a primate retrocyclin; a method for preventing retroviral infection in a cell by administering an effective dose of a circular corpulation of administering an effective dose of retrocyclin to the corpulation of againsm by administering an effective dose of retrocyclin to the microbial organisms; a method for administering arestrocyclin as a therapeutic agent to a patient with an established microbial or viral infection; and a method for administering retrocyclin as a prophylactic agent to prevent a microbial or viral infection in a patient at risk of developing such infection. The retrocyclin peptide has antibacterial and viral infection such as HIV-1. The retrocyclin peptide can be used to treat a viral infection such as HIV-1. The retrocyclin peptide can be used as a vaccine and can be used in immunotherapy. The peptide and polypeptides are useful and viral infections. This sequence represents a retrocyclin cuch and viral infections. This sequence represents a retrocyclin cuch as the invention.

Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immunodeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
 Retrocyclin; infection; sexually transmitted disease; gene therapy; HIV; human immunodeficiency virus; bacterial vaginosis; ophthalmic infection; antibiotic modelling; antimicrobial; cyclic.

defensin analogue is useful for reducing or inhibiting growth or survival of an incroorganism in an environment capable of sustaining the growth or survival or survival of the microorganism and is useful for reducing or inhibiting growth or survival of the microorganism and is useful for reducing or inhibiting or counterful or survival of a microorganism in an environment such as food or food product, a solution (e.g., conteat lens solution), or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbistatic inhibition of growth. Thus the peptides are useful as therapeutic agents, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from bacterial, viral, fungal or other infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present

The present invention describes a method (M1) of using a first anti-viral comprising a theta-defensin peptide in an amphipathic alphace peptide (I) comprising a theta-defensin peptide in an amphipathic alphace helical structure in a lipid environment for reducing the infectivity of a virus. (I) can have virucide and anti-HIV activities, and can be used for include virus and so can be used for inhibiting the growth and confideration of a virus and so can be used for; (a) protecting or treating subject from a viral infection, preventing recurrent viral infection in a subject from a viral infection, preventing recurrent viral infection in a subject from a virally-infection, preventing virus shed from a VS, reducing virus latent virus, controlling virus spread within a virally-infected subject (VS), reducing virus latency in a VS, reducing virus shed from a VS, reducing virus and (C) reducing virus shed from a VS, reducing virus infections virus shed from a VS, reducing virus and (C) reducing virus of virus and (C) reducing virus of virus and (C) reducing virus shed from a population of viruses. (M1) is useful to retain and humans e.g. an enveloped virus infecting humans such as human immunodeficiency virus (HIV). Preferably, the anti-viral peptide is a diministered prior to or subsequent to the virus contacting the subject. The anti-viral peptide is mannistered to a patient whose is immunosuppressed or to a subject who is contacting the virus. The present contacting the virus reducing the virus represent a rheeus monkey thete defensin anti-viral peptide, which is given in the exemplification of the present invention

The invention relates to a theta defensin analogue defined by formulae detailed in the claims or appearing as ADO35239-ADO3527. The theta defensin analogue is useful for reducing or inhibiting growth or survival of a microorganism in an environment capable of sustaining the growth or survival of the microorganism and is useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or sowth or survival of a microorganism in an environment such as food or food product, a solution (e.g., contact lens solution, or eye wash solution), an inanimate object comprising surface, or a mammal. The peptides are also useful for decreasing inflammatory response and for microbicidal inhibition of growth. Thus the peptides are useful as the respectic agence, disinfectants, food preservatives, or medicaments. The peptides are also useful for treating a patient suffering from the peptides are also useful for treating a patient suffering from the peptides are also useful for the infection. The theta defensins have high antimicrobial activity and low haemolytic activity. The present sequence represents the rhesus monkey wild-type theta defensin RTD-2.
 Novel theta defensin analog useful for reducing or inhibiting growth or survival of a microorganism in an environment such as food or food product, contact lens solution, or eye wash solution, an inanimate

 The invention relates to novel retrocyclin peptides. Peptides and methods of the invention are useful for preventing retroviral infections in cells susceptible to bacterial or viral infections, or treating patients having infections such as HIV (human immundeficiency virus), sexually transmitted diseases, bacterial vaginosis or ophthalmic infections. The retrocyclin-mediated killing is useful for modelling and screening novel antibiotics. The invention is also useful in gene therapy. The present sequence is human retrocyclin peptide analogue
 }
 New isolated retrocyclin peptide, useful for preventing retroviral infections in cells susceptible to bacterial or viral infections or treating patients having the infections, such as HIV, sexually transmitted diseases, vaginosis.
